

New dimension of document management

NetroView GmbH, Hamburg/Germany presents the internet based document management system of same denominator in its new version 2.0. This innovative solution was developed with deep contact to the practical experience of advertising agencies and the demands of prepress companies.

The system is – as so far – platform independent. Additional Software und plugins are not necessary. The PDF Document is made available in the internet and can be processed with a browser. Annotations and change requests can be shown and saved textual und graphical.

NetroView 2.0 possesses a totally new architecture: The solution is built completely in Java, Servlets, JSP and Java Applet. The userinterface allows a quick overview and a fast entrance into the editing of documents. Every new change and action is visible immediately.

The new version presents fine scaled system of privileges. On the one hand it is possible to administrate users very fast and easy based on a default configuration. On the other hand you can make a fine tuning on all layers (agency, projects, documents).

Newly added are 'Roles' and 'Groups', which can be defined freely. With these administration effort is smaller. The complete usermanagement is clear, fast and easier.

Until now it was possible to generate a report for a document. Now there is also a projectreport, which documents exactly all actions of the projectmembers as PDF. So a complete overview of the state and the history of a project is available.

The definition of states was enhanced. There is at least a state for start and end of a project. But in between it is now possible to define as much states as necessary. The states can be marked in different colours.

In comparison to the four zoomlevels, which were possible, now it is possible to define up to ten free levels. This demand came out of the prepress sector, where extreme formats are usual.

Work in a team independent of place and time

The applet in the version 2.0 is not only bigger, but has a modern interface oriented by GUI standards. The communication was made better. When a user puts an annotation, it is visible to other users immediately without reload. A board is available for the direct communication between the projectmembers.

The optional 'Moderator' can filter annotations. The agency then receives only moderated annotations.

A 'Navigator' helps to present big documents in the applet in a clear way. Cursors allow to navigate quickly to annotations. The new multi-upload feature makes uploading numerous documents faster.

The system notifies users automatically about new documents and changes made. All versions of a document are available. Sources and additional informations can be integrated in any fileformat.

Down- and uploads and traffic can be reported. The access is restricted by passwords. The transfer can be encrypted. NetroView can also be delivered with an interface to Acrobat 5.0. There are versions in German, English, French, Italian, Spanish and Portuguese.

Annotating online will become a standard, because it saves time and money. With the new version 2.0 the Hamburg software company is in the first front of optimizing workflow.

The client-server system for exchange and coordinating documents can be bought or rented as ASP-solution. Trial Accounts for free: www.netroview.de
